

TREXO: AI Industry Intelligence Agent

Domain

Artificial Intelligence | Agentic AI | Automation | Generative AI

Problem Description

The Artificial Intelligence industry is evolving at an unprecedented pace. Every day, major developments are published across multiple platforms such as OpenAI, Anthropic, Google AI, Microsoft AI, Hugging Face, and Hacker News.

AI engineers, researchers, students, and technology professionals often spend significant time monitoring these sources to stay updated with the latest advancements.

However, the information is scattered across multiple websites, blogs, research publications, and news platforms. Manually tracking, filtering, and analyzing these updates is time-consuming and often results in information overload.

Most news aggregation systems simply collect articles without identifying the most important developments or providing meaningful insights.

There is a need for an intelligent system that can automatically monitor AI news sources, identify high-impact developments, analyze emerging trends, and deliver concise intelligence reports.

Objective

The objective of this project is to build an AI-powered Industry Intelligence Agent that continuously monitors leading AI news sources and generates actionable intelligence briefings.

The system aims to:

- Collect AI news from multiple trusted sources
- Filter and prioritize high-impact developments
- Analyze news using Large Language Models (LLMs)
- Identify emerging trends in the AI industry
- Extract research insights and key takeaways
- Generate concise daily intelligence reports
- Deliver automated briefings through email

Proposed Solution

The proposed system collects information from:

- OpenAI
- Anthropic
- Google AI
- Microsoft AI
- Hugging Face
- Hacker News

The collected information is processed through an automated workflow built using n8n.

The system filters relevant AI-related content, removes noise, aggregates information from multiple sources, and uses an LLM to generate structured intelligence reports.

The final report is automatically delivered to users through email in a newsletter format.

System Workflow

1. Data Collection

Collect AI news and updates from multiple RSS feeds.

2. News Filtering

Filter and retain only relevant AI-related developments.

3. Data Aggregation

Merge and organize news articles from all monitored sources.

4. AI Analysis

Analyze news using an LLM to identify key developments and trends.

5. Intelligence Generation

Generate summaries, insights, and industry observations.

6. Automated Delivery

Deliver daily intelligence briefings through email.

Expected Outcome

The system will:

- Provide daily AI intelligence briefings
- Reduce information overload
- Highlight the most important AI developments
- Identify emerging trends in the AI ecosystem

- Help professionals stay updated efficiently
 - Save time spent monitoring multiple news sources
-

Innovation & Impact

- Automates AI industry monitoring
 - Uses LLMs to analyze and prioritize news
 - Generates actionable intelligence instead of raw news feeds
 - Delivers concise daily briefings
 - Acts as a personal AI industry monitoring assistant
 - Helps users stay informed about rapidly evolving AI technologies
-

Technology Stack

Workflow Automation – n8n

LLM – NVIDIA Nemotron (via OpenRouter)

News Sources – RSS Feeds

Email Service – SMTP (Gmail)

Deployment – Cloud-based Workflow Automation

Conclusion

TREXO is an AI-powered Industry Intelligence Agent designed to monitor, analyze, and summarize developments across the AI ecosystem. By combining workflow automation, RSS aggregation, and Large Language Models, TREXO transforms scattered AI news into actionable intelligence reports, helping professionals stay informed and make better decisions in a rapidly evolving technological landscape.
